Fix This Without Breaking Everything Else

Parts 2 & 3 | Replace the bracketed text with your details, then copy the prompt into your AI tool.

Investigate and fix this specific issue:

Problem: [Describe what is broken.]
Steps to reproduce: [List what you did.]
Expected result: [Describe what should happen.]
Actual result: [Describe what happened.]
Environment: [Test environment, device, browser, and user role.]
Behavior that must stay unchanged: [List related features or rules.]

Confirm the cause from the available evidence before changing anything. If you cannot verify it, explain what information is missing.

Make the smallest change that addresses the cause. Avoid unrelated cleanup, redesigns, new features, or dependency upgrades.

Work in the test environment. If only production is available, report the proposed change and wait for my approval before applying it. Do not delete live records, send customer messages, or publish changes.

After the fix:

1. Repeat the original reproduction steps.
2. Check the related behavior that must stay unchanged.
3. Run any relevant existing checks.
4. Report what changed, what was tested, and anything still unverified.

Do not say the issue is fixed solely because the code changed. Distinguish a proposed fix, a tested fix, and a fix verified in actual use.
